                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      99

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               125 TGTCTGAGCTAACCAAGGGCTGGAGAGTGATGGAGGAGGAGGAGGCCCACATGGAGGAGTG 66

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  260 AAGGACATGGAGATGGACAAAGCTCAGAGAAAGCCCCTGAGGTTTCTCACATCAAAAAGA 319

The present sequence is one such probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, the monitoring and prognosing diseases of the human heart and vaccular system e.g. cardiovascular disease, hypertension, cardiac arrhythmiss and congenital heart disease. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

```
The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid probes useful for analyzing

They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system

BISBASS: HR MUTATION PRODUCES A NUMBER OF PLEIOTROPIC EFFECTS
INCLUDING STRUCTURAL ABNORMALITIES OF EPITHELIAL CELLS IN THE HAIR
FOLLICLES, HAIR LOSS TOWARDS THE END OF THE FIRST HAIR GROWTH
CYCLE, AND THE FAILURE OF SUBSEQUENT HAIR GROWTH CYCLES. OLDER
MICE CARRYING AN HR MUTATION HAVE BEEN REPORTED TO POSSESS ALTERED
RATIOS OF T-CELL-DEPRINGNT B-CELL RESPONSES. MICE HOMOXYGOUG FOR
HR MUTATION ARE UNIQUELY SENSITIVE TO UV AND CHEMICALLY INDUCED
                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

"Isolation of a novel histone deacetylase reveals that class I and class II deacetylases promote SMRT-mediated repression.";

Genes Dev. 14:55-66(2000).

-I- FUNCTION: Mediates the transcriptional repression activity of some nuclear receptors by promoting chromatin condensation, thus preventing access of the basal transcription.

-I- SUBUNIT: Forms a large corepressor complex that contains SIN3A/B and histone deacetylases HPAC1 and HPAC2. This complex associates with the thyroid (TR) and the retinoid acid receptors (RAR) in the absence of ligand, and may stabilize their interaction with TFIIB. Interacts with HDAC10 and MINT (By similarity). Interacts with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY)
                                                                                                                                                                                                                                                                                                                                                                                                          DOMAIN: The N-terminal region contains repression functions that are divided into three independent repression domains (RDI, RD2 and RD3). The C-terminal region contains the nuclear receptorinteracting domains that are divided in two separate interaction domains (IDI and ID2).

DOMAIN: The two interaction domains (ID) contain a conserved sequence referred to as the CORNR box. This motif is required and sufficient to permit binding to unliganded IR and RARS. Sequences flanking the CORNR box determine nuclear hormone receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                specificity.

Antibacterial activity of secretolytin, a chromogranin B-derived
peptide (614-626), is correlated with peptide structure.";
FEBS Lett. 379:273-278(1996).
-!- FUNCTION: Secretogranin I is a neuroendocrine secretory granule
protein, which may be the precursor for other biologically active
peptides. The 16 pairs of basic AA distributed throughout its
sequence may be used as proteolytic cleavage sites.
-!- FUNCTION: Secretolytin has antibacterial activity.
-!- SUBCELLULAR LOCATION: Neuroendocrine and endocrine secretory
                                                                      TISSUE=Adrenal chromaffin;

-!- FUNCTION: Binds to the 37-bp core of the locus control region
(LCR) of the red/green visual pigment gene cluster. May regulate
the activity of the LCR and the cone opsin genes at earlier stages
of development (By similarity).
-!- SUBCELLUIAR LOCATION: Nuclear (By similarity).
-!- SUBCELLUIAR LOCATION: Nuclear (By similarity).
-!- DEVECIPICITY: Restricted to bipolar cells of the retina and
spinal cord.
-!- DEVELOPMENTAL STAGE: At stage 12, expressed throughout the
invaginating optic vesicles and a subset of cells in the ventral
spinal cord, presumably interneuron precursors. At stage 14, when
the optic rup forms, expression is restricted to a subset of
retinoblasts. At stage 15, expression along the ventral spinal and
hindbrain intensifies and persists beyond stage 20.
-!- SIMILARITY: Contains 1 cvC domain.
-!- SIMILARITY: Contains 1 homeobox domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright.
